

MODEL 33 SELF-CONTAINED KEYBOARD

ECONOMICAL . . . FLEXIBLE

The Teletype self-contained keyboard is the answer to the ever increasing demand for low-cost direct parallel-entry of variable data into computers and associated business machines. In most cases it eliminates costly space and time-consuming punched card systems for data collection and transmission. Moreover, the keyboard may be combined with other Teletype communications equipment for complete transmission flexibility.

UNIQUELY DIFFERENT

Teletype's self-contained keyboard is uniquely different than conventional keyboards because its reset mechanism which allows the next key to be depressed is triggered automatically by an external electric source. A simple connection to the computer will give you the external power needed.

The keyboard's contact block contains a universal contact which closes with each key depression, and may be used to trigger the external circuitry.

MODERN DESIGN

Key arrangement is similar to an ordinary four-row alphanumeric typewriter. A light, uniform touch is consistently assured through instant, easy key action. Its clean-line design coupled with new, improved key angle increases operator input, efficiency, and comfort.

FACTS AND FEATURES

The keyboard conforms to the newly adopted 8-level ASCII code, and requires only a 115 volt, AC pulse of approximately 12 milliseconds to actuate the reset mechanism. It includes one "ON-OFF" push button with built-in "POWER-ON" lamp and a copyholder to facilitate operating ease and convenience. A fuse, easily accessible from the bottom of the keyboard, and a 36-point connector are also provided.

APPROXIMATE DIMENSIONS

Height	10 $\frac{1}{8}$ inches
Width	16 $\frac{1}{4}$ inches
Depth	6 $\frac{1}{2}$ inches
Speed	100 words per minute
Weight	13 lbs.

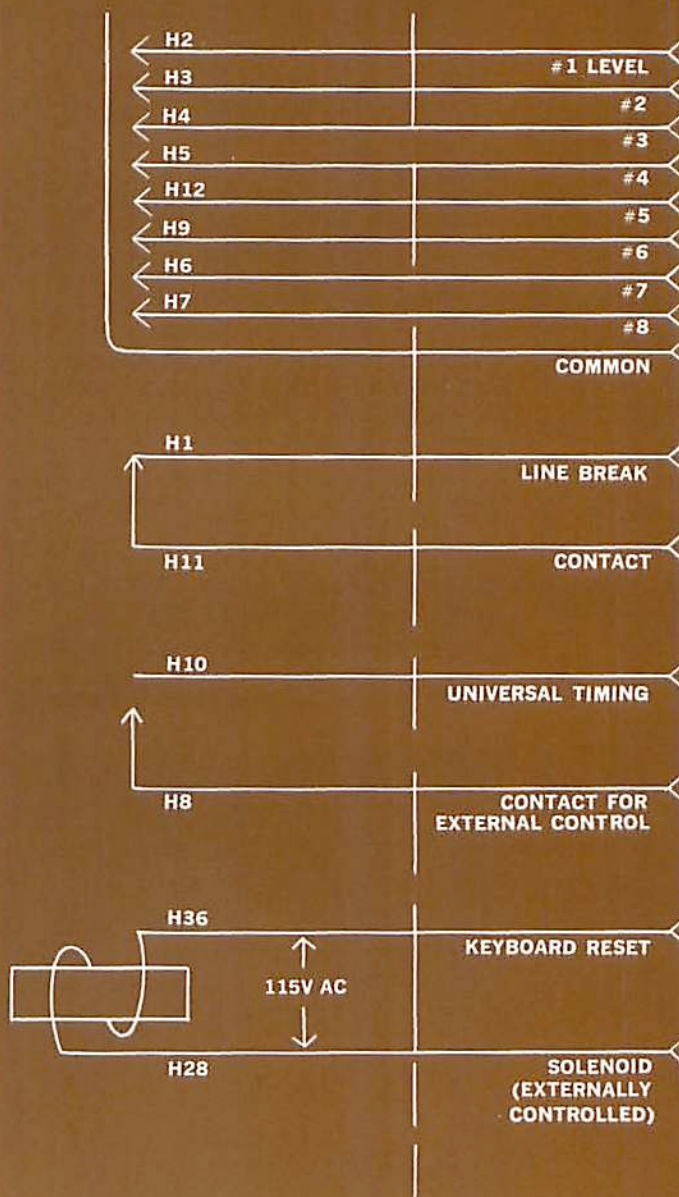

This equipment is manufactured for our parent company, Western Electric, Bell System affiliates and others who require dependable communications at the lowest possible cost.
